

UI Design - Recall AI

Project: RecallAI | Version: 1.0 | Date: 2026-07-26
Figma: <https://www.figma.com/design/Xw978kqnMs9efJNzrSTPJf/RecallAI>

1. Study Plans - Dashboard

1.1 Study Plans List View

Study Plans List View - Primary

Study Plans List View - Secondary

Purpose: The Study Plans dashboard serves as the main entry point where users manage all their active and archived learning plans. It gives a high-level overview of study progress and quick access to individual plans.

What it shows: A sidebar navigation on the left with sections (Workspace, Intelligence) and menu items (Study Plans, Knowledge Base, Calendar, AI Examiner). The main content area displays a grid of Study Plan cards, each showing the plan title, subject icon, document count, concept count, overall progress bar, and next review date. A 'New Study Plan' button appears at the top right of the content area.

How users use it: Users click any plan card to open that specific study plan and view its concept graph. They click the 'New Study Plan' button (top-right) to start the creation wizard. They use the left sidebar to navigate to other sections such as Calendar or AI Examiner. Progress bars on each card help users quickly identify which subjects need attention.

1.2 Concept Graph Overview (Default State)

Concept Graph Overview - Primary

Concept Graph Overview - Secondary

Purpose: This screen presents the concept graph for a selected study plan, allowing users to visualise the relationships between all concepts in the subject and assess their current mastery level at a glance.

What it shows: An interactive node-link graph occupying the main content area. Each node represents a concept, colour-coded by mastery level (green = strong, orange = learning, red = weak, grey = not reviewed). The right-hand panel shows a summary of total concepts, mastery statistics, and a 'Start Review' call-to-action button. A filter toolbar at the top lets users filter nodes by mastery category.

How users use it: Users click an individual concept node to open a detail panel with the concept's definition and mastery score. They use the filter buttons (All / Strong / Learning / Weak / Not Reviewed) to focus on specific groups. Clicking 'Start Review' in the right panel launches the AI-driven review session for the weakest concepts.

2. Create New Study Plan

2.1 Enter Study Plan Information

Enter Study Plan Information - Primary

The screenshot shows the 'Create New Study Plan' interface. On the left is a sidebar with the 'Recall AI Planner' logo and navigation links: 'Workspace' (Dashboard, Study Plans, Focus Session), 'Intelligence' (AI Interview, History Log), and user information (Minh Nguyễn, Settings, Log Out). The main area is titled 'Create New Study Plan' and features a three-step progress bar: '1. Info' (active), '2. Process', and '3. Verify'. A central modal form titled 'Study Plan Information' contains a 'Study Plan Name' text input, a 'Deadline' date selector, a file upload area with a cloud icon and 'Upload File' button, and a 'Next: Process' button at the bottom.

Enter Study Plan Information - Secondary

Purpose: This is the first step of the multi-step Study Plan creation wizard. It collects the essential metadata-plan name, subject, and source documents-before the AI generates the concept graph.

What it shows: A centred modal or full-screen form containing: a text input for the plan name, a subject/topic dropdown, a document upload area (drag-and-drop or file-picker), and a step indicator showing the user is on Step 1 of 2. A 'Next' primary button and a 'Cancel' ghost button appear at the bottom of the form.

How users use it: Users type the plan name, select or type a subject, then either drag-and-drop files or click the upload zone to pick documents from their device. Once all required fields are filled, they click 'Next' to proceed to Step 2 (verification). Clicking 'Cancel' discards all input and returns to the Study Plans dashboard.

2.2 Verify Generated Concepts

Verify Generated Concepts - Primary

Verify Generated Concepts - Secondary

Purpose: This is the second step of the creation wizard, where users review and confirm the AI-generated list of concepts before the final knowledge graph is built and saved.

What it shows: A list of AI-extracted concept chips arranged in rows, each with a concept name and a remove (X) button. A progress/loading indicator may appear if the AI is still processing. At the bottom, a 'Create Study Plan' primary button finalises the graph, while a

'Back' ghost button returns to Step 1. An 'Add Concept' inline control lets users manually add missing concepts.

How users use it: Users review every concept chip, clicking X to remove incorrect or irrelevant entries. They type in the 'Add Concept' field and press Enter (or click '+') to insert missing concepts. Once satisfied, they click 'Create Study Plan'; the system saves the graph and redirects to the new plan's concept graph screen.

3. Concept Graph - Filtered Views

3.1 Concept Graph: Filter by All

Concept Graph: Filter by All - Primary

Concept Graph: Filter by All - Secondary

Purpose: This screen displays the complete concept graph with all mastery levels visible, giving users a full overview of the entire knowledge map for a study plan.

What it shows: All concept nodes rendered in the graph canvas: green nodes (Strong), orange nodes (Learning), red nodes (Weak), and grey nodes (Not Reviewed). The filter toolbar at the top shows 'All' as the active filter. A legend panel explains the colour coding. The right summary panel shows aggregate counts for each mastery category.

How users use it: Users pan and zoom the graph using mouse drag and scroll. Clicking any node opens a detail card on the right showing the concept's definition, mastery percentage, and last reviewed date. The 'All' filter is the default state when opening the concept graph for the first time.

3.2 Concept Graph: Filter by Not Reviewed

Concept Graph: Filter by Not Reviewed - Primary

Concept Graph: Filter by Not Reviewed - Secondary

Purpose: This filtered view isolates only the concepts that the user has never reviewed, helping them prioritise new material and ensure no topic is overlooked.

What it shows: Only grey 'Not Reviewed' nodes are highlighted in the graph; all other nodes are dimmed or hidden to reduce visual noise. The 'Not Reviewed' filter button is highlighted in the toolbar. A counter in the right panel shows the number of unreviewed concepts and a 'Start Review' button specific to this subset.

How users use it: Users click the 'Not Reviewed' filter button in the toolbar to switch to this view. They click individual grey nodes to read the concept definition before deciding to include it in a review session. Clicking 'Start Review' in the right panel launches an AI review session focused exclusively on these unreviewed concepts.

4. Concept Graph - Weak Filter

4.1 Concept Graph: Filter by Weak

[IMAGE NOT FOUND: study plans-concept graph-filter-weak--lightmode.png]

Concept Graph: Filter by Weak - Primary

Concept Graph: Filter by Weak - Secondary

Purpose: This view isolates concepts where the user's mastery score is below the threshold (e.g., below 60%), allowing them to focus review effort on the most critical gaps.

What it shows: Only red 'Weak' nodes are prominently displayed. Other nodes fade to near-invisible. The right summary panel updates to show only weak-concept statistics: total weak count, average mastery score for weak concepts, and days since last reviewed. A prominent 'Review Weak Concepts' button appears in the panel.

How users use it: Users activate this view by clicking the 'Weak' filter in the toolbar. They can identify which concepts need urgent attention from the visual layout. Clicking a red node reveals detailed mastery history in the right panel. 'Review Weak Concepts' starts a targeted AI-driven review session for those nodes only.

4.2 Successfully Created Study Plan Graph

Successfully Created Study Plan Graph - Primary

Successfully Created Study Plan Graph - Secondary

Purpose: This confirmation screen appears immediately after a new study plan has been successfully created and the concept graph has been generated, giving the user a first look at their new knowledge map.

What it shows: The newly generated concept graph rendered for the first time. All nodes begin in the 'Not Reviewed' (grey) state. A success toast/banner at the top confirms that the plan was created. The right panel shows an onboarding prompt encouraging the user to start their first review session. The plan name and subject are shown in the top breadcrumb.

How users use it: Users review the auto-generated concept layout to verify it matches their expectations. They can immediately click 'Start First Review' in the right panel or dismiss the prompt and explore the graph manually first. From this screen they can also go back to the dashboard using the breadcrumb navigation.

5. Concept Definition Panel

5.1 Concept Node: Detailed Definition View

Concept Node: Detailed Definition View - Primary

Purpose: This screen shows the expanded detail panel for a selected concept node, giving users the full AI-generated definition, mastery metrics, and editing options for that specific concept.

What it shows: The concept graph remains in the background (dimmed). A right-side slide-in panel displays: concept title, mastery percentage badge, full definition text paragraph, related concepts list, review history (dates and scores), and action buttons ('Edit Definition', 'Mark as Mastered', 'Schedule Review').

How users use it: Users click any concept node on the graph to trigger this panel. They read the definition to refresh their understanding. They click 'Edit Definition' to enter edit mode (see 5.2. Edit Concept Definition). They can click 'Mark as Mastered' to manually promote the node to green, or 'Schedule Review' to add this concept to the next review session.

5.2 Edit Concept Definition

study plans-create new study plan-verify-edit concept-lightmode

Edit Concept Definition - Primary

Purpose: This edit mode allows users to modify the AI-generated definition of a concept, ensuring the content matches their course materials or personal understanding.

What it shows: The right panel transitions into edit mode: the definition text becomes an editable textarea pre-populated with the existing definition. A character counter, 'Save' primary button, and 'Cancel' ghost button appear below the textarea. The concept title remains as a read-only header above the editor.

How users use it: Users click inside the textarea and modify the definition text. They can use standard keyboard shortcuts (Ctrl+A, Ctrl+Z) for editing. Clicking 'Save' commits the changes and returns to the detailed view (5.2. Concept Node: Detailed Definition View). Clicking 'Cancel' discards all edits and reverts to the previous definition.

6. Review Schedule

6.1 Review Schedule Calendar

Edit Concept Definition - Primary

Edit Concept Definition - Secondary

Purpose: The Review Schedule screen displays a calendar-style view of all upcoming spaced repetition review sessions, helping users plan their study time and track their consistency.

What it shows: A monthly or weekly calendar grid where each day column lists concepts scheduled for review on that date. Each concept chip in the calendar shows the concept name and the associated study plan. Days with many reviews have a visual load indicator. A header shows the current week/month with forward/back navigation arrows.

How users use it: Users navigate the calendar using the arrow buttons to view past or future weeks. Clicking a concept chip on the calendar opens its detail panel. Users can drag and drop concept chips to reschedule reviews to a different day. A 'Today' button quickly returns to the current date view.

6.2 Update Study Plan Document

Update Study Plan Document - Primary

Update Study Plan Document - Secondary

Purpose: This screen allows users to add, replace, or remove source documents associated with a study plan, triggering the AI to update the concept graph with any new information from the updated materials.

What it shows: A document management panel listing all currently attached source files with their name, size, and upload date. Each file row has a 'Remove' icon button. A drag-and-drop upload zone at the bottom allows adding new documents. An 'Update Graph' primary button triggers AI re-analysis of the changed document set.

How users use it: Users click the remove icon (trash/×) next to a file to detach it from the plan. They drag new files or click the upload zone to add updated lecture notes or textbook chapters. After making changes, they click 'Update Graph' to initiate AI re-extraction of concepts. A confirmation dialog (see next screen) asks them to verify before the update proceeds.

7. Update Document - Confirmation

7.1 Confirm Document Update

study-plan-update-document-confirm-lightmode

Confirm Document Update - Primary

Purpose: This confirmation dialog prevents accidental graph re-generation by explicitly asking the user to acknowledge the consequences of updating source documents before the AI begins re-processing.

What it shows: A modal dialog overlaid on the document management screen. It displays: a warning icon, a title ('Update Study Plan?'), a description of what will happen (concepts may be added, modified, or removed; review history will be preserved), a 'Confirm Update' primary button, and a 'Cancel' ghost button.

How users use it: Users read the consequences described in the dialog body. Clicking 'Confirm Update' closes the dialog and triggers AI re-analysis in the background; a loading state is shown on the 'Update Graph' button during processing. Clicking 'Cancel' closes the dialog without making any changes, returning the user to the document management panel.

7.2 Document Upload In Progress

Document Upload In Progress - Primary

Purpose: This state of the Update Document screen shows real-time file upload progress, giving users feedback while large documents are being transferred to the server.

What it shows: The document list panel with one or more files showing an inline progress bar instead of the file size. A percentage label updates in real time. The 'Update Graph' button is disabled (greyed out) with a 'Uploading...' label until all uploads complete. A cancel upload (X) button is available per-file.

How users use it: Users observe the upload progress bars automatically - no interaction is required during the upload. They can click the per-file X to abort an individual upload if needed. Once all progress bars reach 100%, they disappear and the file size label returns; the 'Update Graph' button becomes active and the user proceeds as in 7.1. Confirm Document Update.
